<td>N/A</td>
<td>Review the rationale for treating acute and chronic vertigo with different therapeutic options.</td>
<td>Acute vertigo may represent labyrinthine dysfunction treated with medication or a more serious central nervous system process requiring prompt intervention to avoid long-term disability. Chronic vertigo, however, may require surgical or rehabilitative measures for lasting relief.</td>

Labyrinthine enhancement on gadolinium-enhanced magnetic resonance imaging in sudden deafness and vertigo: correlation with audiologic and electronystagmographic studies. <em>Ann Otol Rhinol Laryngol</em> 1992; 101(6):459-464.</td>
<td>Review/Other-Dx</td>
<td>12 patients</td>
<td>To describe patients with enhancement of the cochlea and/or vestibule on gadolinium-diethylenetriamine pentaacetic acid-enhanced MRI, correlating the enhancement with the auditory and vestibular function.</td>
<td>Cochlear enhancement on the side of hearing loss was found in all patients. No labyrinthine enhancement was seen in a series of 30 control patients studied with the same MRI protocol. Labyrinthine enhancement is indicative of labyrinthine disease. Enhanced MRI may separate patients with retrocochlear lesions, such as acoustic neuromas, from those in whom the abnormal process is in the labyrinth or the brain.</td>

<td>Observational-Dx</td>
<td>27 patients; 27 control patients; 108 total temporal bones</td>
<td>To retrospectively determine, by using thin-section MDCT, whether additional reformations in the planes of Stenver and Poschl change the diagnostic interpretation for SSC dehiscence when compared with the diagnostic interpretation of standard coronal reformations for SSC dehiscence.</td>
<td>Observer 1 diagnosed SSC dehiscence in 25/108 (23%) temporal bones and had no discords between the two reviews. Observer 2 diagnosed SSC dehiscence in 21/108 (19%) temporal bones and had one intraobserver discordance. After a post hoc consensus review of this one discordance, the radiologic diagnosis remained equivocal. The discordance involved the right temporal bone of a patient suspected of having SSC dehiscence in the left temporal bone, so no clinical follow-up was available.</td>

### Reference Study Type Patients/Events Study Objective (Purpose of Study) Study Results
61. Kikuchi S, Kaga K, Yamasoba T, Higo R, O'Uchi T, Tokumaru A. Slow blood flow of the vertebrobasilar system in patients with dizziness and vertigo. *Acta Otolaryngol* 1993; 113(3):257-260. Observational-Dx 102 patients To determine value of MRI to detect vertebrobasilar insufficiency in patients over 50. Slow blood flow in the vertebrobasilar system was detected in 36 patients (35%). MRI is recommended for evaluation of vascular disorders in older patients with vestibular symptoms. 3

62. Norrving B, Magnusson M, Holtas S. Isolated acute vertigo in the elderly; vestibular or vascular disease? *Acta Neurol Scand* 1995; 91(1):43-48. Observational-Dx 24 patients Prospectively study patients (50-75 years) with the acute onset of isolated vertigo lasting >48 hours and no abnormality on neurological examination other than nystagmus. Study protocol included neuro-imaging (MRI 22 patients, CT 2 patients), Doppler US, and electro-oculography. MRI/CT showed the presence of an infarction of the caudal cerebellum in 6 patients (25%). MRI of the posterior fossa was normal in 18 patients. On electro-oculography, ataxic pursuit eye movements were a characteristic finding in patients with cerebellar infarction, whereas caloric test findings were not discriminative. 3

Evidence Table Key

Study Quality Category Definitions

- **Category 1**  The study is well-designed and accounts for common biases.
- **Category 2**  The study is moderately well-designed and accounts for most common biases.
- **Category 3**  There are important study design limitations.
- **Category 4**  The study is not useful as primary evidence. The article may not be a clinical study or the study design is invalid, or conclusions are based on expert consensus. For example:
  a) the study does not meet the criteria for or is not a hypothesis-based clinical study (e.g., a book chapter or case report or case series description);
  b) the study may synthesize and draw conclusions about several studies such as a literature review article or book chapter but is not primary evidence;
  c) the study is an expert opinion or consensus document.

Dx = Diagnostic
Tx = Treatment

Abbreviations Key

3DFT = 3D Fourier transformation
ABR = Auditory brainstem response
CPA = Cerebellopontine angle
CISS = Constructive interference in steady state
CT = Computed tomography
FLAIR = Fluid-attenuated inversion-recovery
FSE = Fast spin-echo
HRCT = High-resolution computed tomography
IAC = Internal auditory canal
MRI = Magnetic resonance imaging
PPV = Positive predictive value
SNHL = Sensorineural hearing loss
SSC = Superior semicircular canal
US = Ultrasound
